PM

When data is ingested into the Ed-Fi ODS / API, the validation of data and errors that occur in the process is important information for other data operations. This session will discuss generally the types of errors and validation notices that occur during data ingestion and how to make that information known via API to other consumers of that data. Also we'll discuss various approaches such as should a validation API be done via an extension or other ways to store the data.

These broad session notes attempt to capture the spirit of the discussion and should not be interpreted as a transcript. Although Ed-Fi Alliance staff were involved in capturing these observations, the notes below should not be construed as official, complete, or 100% accurate.
